**Investor horizon and information choice:
Do long-term investors matter for price informativeness?**

2026

I show that long-term and short-term investors play distinct and time-varying roles in improving stock market informational efficiency. The contribution of long-term investors to price informativeness increases over time, particularly after 2004 and among firms with low-quality information, while the contribution of short-term investors declines. Exploiting long-term investors' exits as an exogenous shock to long-term ownership, I find that the exit of long-term investors with significant ownership stakes (greater than 5%) is associated with a subsequent decline in price informativeness. I develop a heterogeneous-agent model in which investors allocate information-acquisition resources across signals with different horizons. Long-term investors allocate relatively more resources to information about future asset fundamentals, whereas short-term investors devote relatively more resources to contemporaneous demand signals. Consistent with the model, firms with a larger share of long-term investors exhibit greater price informativeness. Overall, the findings highlight the important and increasingly prominent role of long-term investors in incorporating fundamental information into stock prices.

The information content of adviser risk disclosure

2026

I examine whether advisers' risk disclosures contain information that predicts the risk and performance of their long-equity holdings. I document that advisers with different investment horizons exhibit distinct incentives to disclose risk- and performance-relevant information. Among short-term transient advisers, risk disclosures positively predict subsequent portfolio risk but negatively predict future risk-adjusted returns. In contrast, among long-term dedicated advisers, risk disclosures are positively associated with future risk-adjusted returns. Economically, advisers in the highest risk-disclosure tercile outperform those in the lowest tercile by 5.5 percentage points per year before fees, based on DGTW-adjusted returns. Event-based evidence further suggests that long-term dedicated advisers in the highest risk-disclosure tercile appear more skilled at exploiting investment opportunities around corporate events. The finding that long-term dedicated advisers are more willing to disclose performance-relevant information is consistent with the higher arbitrage costs associated with long-term mispricing.

Conferences/Seminars

UBC Summer Conference (poster)	Jul 2026
Northern Finance Association (poster)	Sep 2026
International Behavioural Finance Conference (presentation)	Oct 2026
Simon Fraser University (presentation)	Nov 2026
Sydney Banking and Financial Stability Conference (presentation)	Dec 2026
Australasian Finance and Banking Conference (presentation)	Dec 2026
New Zealand Finance Meeting (presentation)	Dec 2026
FMA (discussant)	2025
UBC summer conference (participants)	2022 - 2026
PNWFC (participant)	2024 - 2025
FIRS (participant)	June 2023

Research experience	Finance, University of British Columbia	
	Research Assistant for Lorenzo Garlappi	2026-
	Research Assistant for Isha Agarwal and Shaojun Zhang	2026-
	Research Assistant for Adlai Fisher and Jiri Knesl	2024-2025
	Research Assistant for Bo Bian and Jan Bena	2022-2023
	Research Assistant for Elena Pikulina	2022
Teaching experience	Finance, University of British Columbia	
	Instructor, Applied Financial Markets	2026
	Teaching Assistant to Adlai Fisher, Portfolio Management	2025-2026
	Teaching Assistant to Shaojun Zhang, Investment Policy	2026
	Teaching Assistant to Lorenzo Garlappi, Investment Policy	2024-2025
Industry experience	DBS Bank, Shanghai	
	Financial Controller, Finance Department	2019-2021
